Chapter 1. Introduction

This document describes the integration of a Cohesity DataPlatform with the Entrust KeyControl Key Management Solution (KMS). Entrust KeyControl can serve as a KMS to a Cohesity cluster using the open standard Key Management Interoperability Protocol (KMIP).

Mutual authentication of each entity is performed using X.509 certificates over a Transport Layer Security (TLS) secure channel.

After deploying and configuring Entrust KeyControl, a KMS certificate is automatically generated and signed by the internal Certificate Authority (CA). The internal CA generates the X.509 client certificate that is uploaded to the Cohesity cluster for authentication.

If your organization mandates all certificates to be signed by a specific CA, KeyControl can use your organization's CA to sign its certificate.

Once configured, the Cohesity cluster will request a Key Encryption Key (KEK) from KeyControl for the entire cluster. This KEK securely wraps (encrypt/decrypt) the Data Encryption Keys (DEKs) created and stored locally in the Cohesity cluster. The DEKs are used to encrypt and decrypt the data in the Cohesity cluster. Cohesity retrieves the KEKs from KeyControl after a reboot or a restart of the keychain service. If KeyControl is unavailable, the data in the Cluster and Storage Domains will remain encrypted and inaccessible.

1.1. Documents to read first

This guide describes how to configure the Entrust KeyControl server as a KMS in Cohesity.

To install and configure the Entrust KeyControl server cluster, see [KeyControl Installation and Upgrade Guide](#). For information on configuring Entrust KeyControl as a KMIP server, see [KeyControl KMIP Vault Overview](#).

Also refer to the [Cohesity online documentation](#).

1.2. Requirements

- Entrust KeyControl version 5.4 or later.

An Entrust KeyControl license is required for the installation. You can obtain this license from your Entrust KeyControl account team or through Entrust KeyControl customer support.

- Cohesity DataProtect version 6.8.2 or later.

A Cohesity license is required for the installation. You can obtain this license from your Cohesity account team or through Cohesity customer support.

Entrust recommends that you allow only unprivileged connections unless you are performing administrative tasks.

1.3. High-availability considerations

Entrust KeyControl uses an active-active deployment, which provides high-availability capability to manage encryption keys. Entrust recommends this deployment configuration. In an active-active cluster, changes made to any KeyControl node in the cluster are automatically reflected on all nodes in the cluster. For information about Entrust KeyControl, see the [Entrust KeyControl Product Overview](#).

1.4. Product configuration

The integration between the Cohesity DataPlatform, Entrust KeyControl, and nShield HSM has been successfully tested in the following configurations:

Product	Version
Cohesity DataProtect (Virtual Edition for VMware)	6.8.2
Entrust KeyControl	10.2

Chapter 2. Procedures

2.1. Install and configure Entrust KeyControl

To install and configure the Entrust KeyControl server cluster, see [KeyControl Installation and Upgrade Guide](#). For information on configuring Entrust KeyControl as a KMIP server, see [KeyControl KMIP Vault Overview](#).

Make sure the Entrust KeyControl Vault gets created and KMIP certificates are generated for Cohesity. These certificates are used in the configuration of the KMS described below.

2.2. Deploy Cohesity DataProtect

Deploy Cohesity DataProtect as described in the Cohesity user documentation: <https://docs.cohesity.com/>.

2.3. Create Cohesity client certificates in KeyControl

Before we can enable encryption, Cohesity and the KeyControl server must establish a mutual trust relationship. Client certificates are required to facilitate two-way KMIP communications between the KeyControl server and Cohesity. To perform this operation, create the certificate bundle as described in the [Managing KMIP Client Certificates](#) section of the *Entrust KeyControl Admin Guide*.

The configuration was tested using certificates without password protection. This client certificate is used to securely authenticate with the Entrust KeyControl server. After you create and download these certificates, you need to upload or import them into the Cohesity appliance.

1. Log in to the Entrust KeyControl server.
2. Select the **Security** icon, then select **Client Certificates > +**.
3. In the **Create a New Client Certificate** dialog, enter the **Certificate Name** and **Expiration Date**.
4. Leave the **Password** field blank.

This integration requires a password-less client certificate.

5. Select **Create**.

6. After the certificate has been created, select it, and select **Action > Download Certificate**.

7. This downloads a zip file that contains:

- A `<cert_name>.pem` file that includes both the client certificate and private key.

In our scenario this file is called `COHESITY.pem`.

The client certificate section of the `<cert_name>.pem` file includes the lines "`-----BEGIN CERTIFICATE-----`" and "`-----END CERTIFICATE-----`" and all text between them.

The private key section of the `<cert_name>.pem` file includes the lines "`-----BEGIN PRIVATE KEY-----`" and "`-----END PRIVATE KEY-----`" and all text in between them.

- A `cacert.pem` file, which is the root certificate for the KMS cluster. It is always named `cacert.pem`.

You will use these files in the Cohesity configuration.

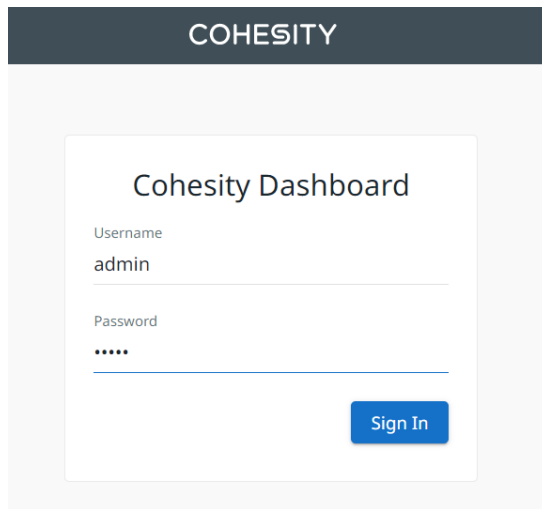

2.4. Configure Cohesity for encryption with an external Key Management System

2.4.1. Configure the Cohesity cluster

This section assumes that you have not configured the Cohesity DataProtect cluster. If you have already configured this cluster, you can skip to [Select the Key Management System](#).

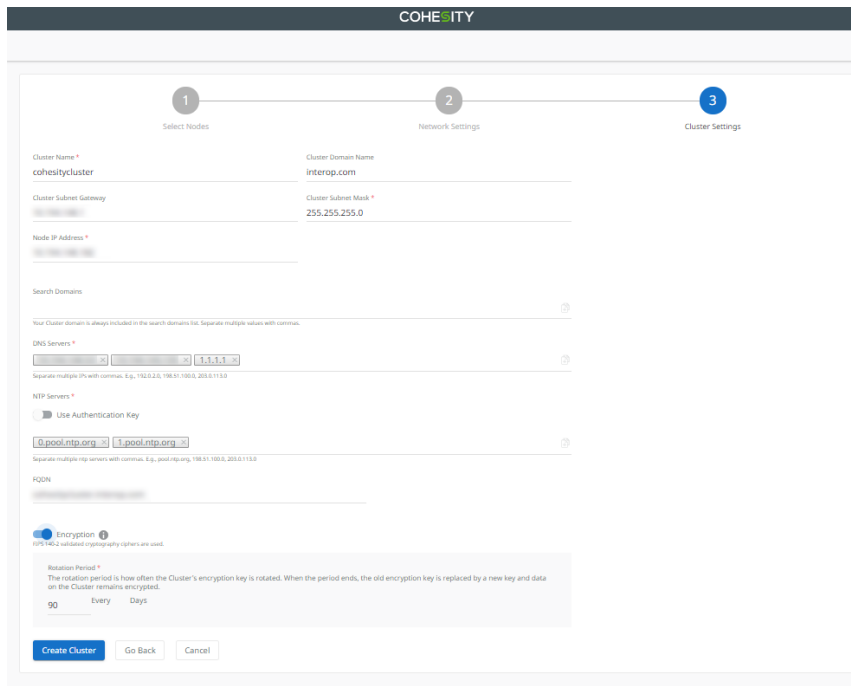

1. Log in to the Cohesity Web UI:
 - a. Point your browser to the Cohesity Appliance IP Address.
 - b. Log into the Cohesity Web UI with the default username and password (admin/admin).

```
https://IP_ADDRESS.
```

The image shows the Cohesity login interface. At the top, there is a dark header with the word "COHESITY" in white. Below this is a white box containing the "Cohesity Dashboard" title. Underneath the title are two input fields: "Username" with the text "admin" and "Password" with masked characters "••••". A blue "Sign In" button is positioned at the bottom right of the white box.

2. On **Virtual Edition Cluster Setup**, select **Get Started**.
3. Enter cluster information.

The image displays the "Virtual Edition Cluster Setup" form in the Cohesity interface. The form is divided into three steps: 1. Select Nodes, 2. Network Settings, and 3. Cluster Settings. The "Cluster Settings" step is currently active. The form contains the following fields and options:

- Cluster Name ***: cohesitycluster
- Cluster Domain Name**: interop.com
- Cluster Subnet Gateway**: 192.0.2.1
- Cluster Subnet Mask ***: 255.255.255.0
- Node IP Address ***: 192.0.2.1
- Search Domains**: A text input field with a search icon.
- DNS Servers ***: A list of IP addresses, currently showing 1.1.1.1.
- NTP Servers ***: A list of NTP server addresses, currently showing pool.ntp.org.
- Use Authentication Key**: A checkbox that is currently checked.
- Rotation Period ***: A dropdown menu set to "90" days.

At the bottom of the form, there are three buttons: "Create Cluster" (highlighted in blue), "Go Back", and "Cancel".

- a. In **Cluster Name**, enter the name of the cluster.
- b. In **Cluster Domain Name**, enter the name of the domain.
- c. In **Cluster Subnet Gateway**, enter the subnet gateway IP address.
- d. In **Cluster Subnet Mask**, enter the subnet mask.
- e. In **Node IP Address**, enter the node IP address.
- f. In **DNS Servers**, enter the IP addresses for all required DNS servers. Separate DNS servers with commas. For example: 192.0.2.0, 198.51.100.0, 203.0.113.0

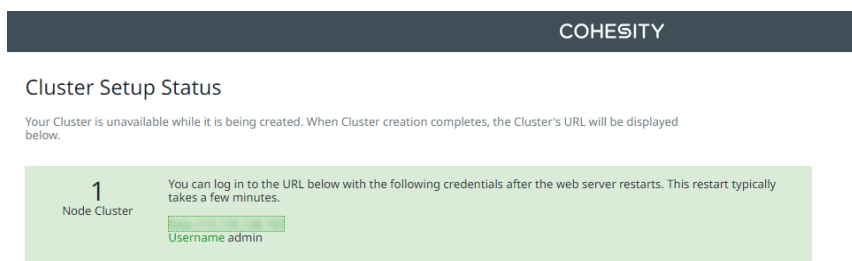

- g. In **NTP Servers**, enter the IP addresses for all required NTP servers. Separate NTP servers with commas. For example: 0.pool.ntp.org, 1.pool.ntp.org
- h. In **FQDN**, enter the full qualified domain name of the cluster.
- i. Optionally, enable **Encryption** at the cluster level. If you enable encryption at the cluster level, all storage domains created in the cluster will be automatically encrypted with FIPS 140.2 validated cryptography ciphers. You must also set a **Rotation Period** for the cluster's encryption key. At the end of each rotation period, the cluster encryption key is replaced, and all data remains encrypted.

If encryption is not enabled at the cluster level, you can enable encryption during the Storage Domain creation process if required.

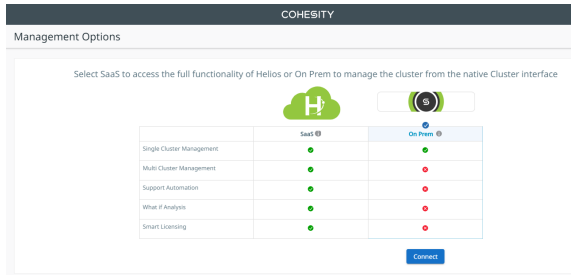

4. Wait until the cluster setup completes.

Once the setup is complete, wait a few minutes until the web services are restarted.

- 5. Log in again to the cluster.
- 6. Accept the End User License Agreement.
- 7. In **Management Options**, select either **SaaS** or **On Prem**.

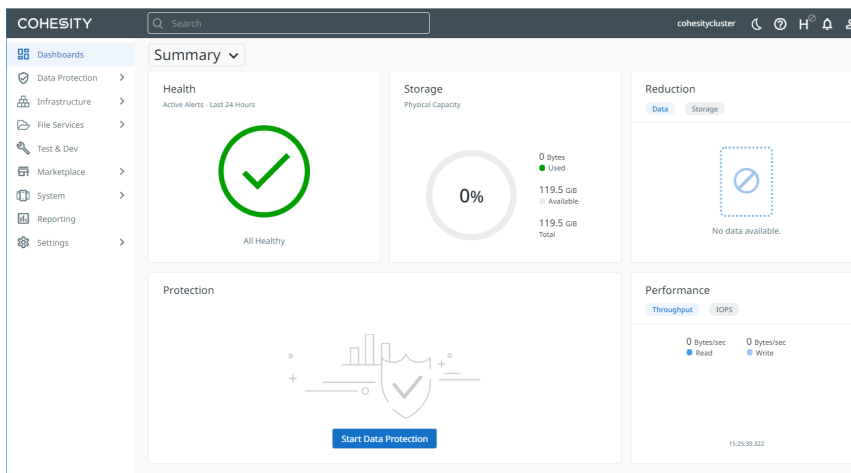

8. On **Select preferred mode for licensing**, select Helios licensing or manual licensing.

Obtain the license from your Cohesity account team or through Cohesity customer support.

9. Change the **admin** password.

The Cluster Dashboard appears. For example:

10. Select **Settings > Summary** in the left side bar to view the **Cluster Summary**. For example:

2.4.2. Select the Key Management System

1. Log in to the Cohesity cluster.
2. Select **Key Management System**.
3. In **Key Management System**, create the external Key Management System by selecting **Add New Key**.

New Key

Key Name

KeyControlKey

A name to identify your key with

Key Configuration

Key Type

KMIP Compliant AWS

Protocol Version

KMIP1_2

Server Address

10.194.148.215

Port

5696

Upload Certificates

Select Storage Domain and External Target (Optional)

Cancel

Create

4. Expand **Key Configuration**:
 - a. In **Key Type**, select **KMIP Compliant**.
 - b. In **Protocol Version**, select the protocol version that Entrust KeyControl is configured to use. The KMIP version used in Cohesity must match the

version used in Entrust KeyControl. Versions supported by Cohesity and KeyControl are **KMIP1_1**, **KMIP1_2**, and **KMIP1_3**.

- c. In **Server Address**, enter the IP address of the KeyControl server.
- d. In **Port**, enter **5696**.

5. For the Certificates, expand **Upload Certificates**:

New Key

Key Name

KeyControlKey

A name to identify your key with

 Key Configuration

 Upload Certificates

Client Certificate

client_certificate.pem X

Client Key

private_key.pem X

CA Certificate

cacert.pem X

 Select Storage Domain and External Target (Optional)

Cancel

Create

- These will be the certificates created in KeyControl that have been downloaded before.
- Certificates must be in PEM format.
- There should be two files: **COHESITY.pem** and **cacert.pem**.
- Break up the **COHESITY.pem** file into two separate files. One file to contain the public key. The other file to contain the private key.
- In **Client Certificate**, select the public key file created from **COHESITY.pem**.
- In **Client Key**, select the private key file created from **COHESITY.pem**.
- In **CA Certificate**, select the **cacert.pem** file.
- For example, the **client_certificate.pem** file contains the public key from inside **COHESITY.pem** file.

```
-----BEGIN CERTIFICATE-----

-----END PRIVATE KEY-----

```

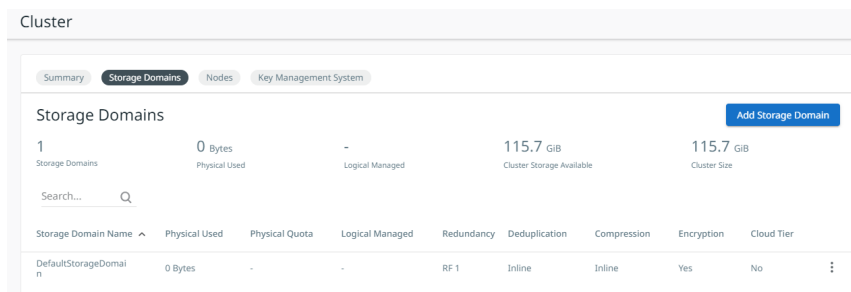

6. Select **Save** to save the settings.

2.5. Create a Cohesity storage domain that uses KeyControl for encryption

If you already have a suitable storage domain that you want to use, Cohesity supports the migration of data from internal to external KMSs. To migrate a KMS instead of creating a new storage domain, see the Cohesity documentation: https://docs.cohesity.com/7_1_2/Web/UserGuide/Content/Dashboard/Admin/migrate-kms.htm

To create a new storage domain:

1. In **Settings > Summary**, select **Storage Domains**.

2. Select **Create Storage Domain**.

Storage Domain Name
Name
MyStorageDomain

Authentication Provider
 None (Public Access)
 Active Directory
 LDAP

Deduplication
 Inline (Recommended)
Deduplication occurs as the Cluster saves blocks to the partition
 Post Process
Deduplication occurs after the Cluster writes data to the partition

Compression
 Inline (Recommended)
Compression occurs as the Cluster saves blocks to the partition
 Post Process
Compression occurs after the Cluster writes data to the partition

Encryption
Note: Once enabled, it cannot be disabled

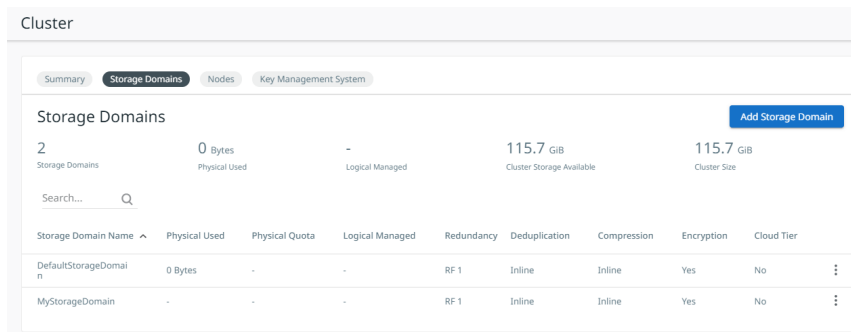

Key Management Service (KMS) Type
KMIP Compliant

KMS Compliant Key
KeyControlKey

Once a KMIP Compliant Key is selected, it cannot be changed later

3. In **Storage Domain Name**, enter the **Storage Domain Name**.
4. Select **Encryption**. This enables encryption at the cluster level.
5. In **Key Management Service (KMS) Type**, select **KMIP Compliant** from the drop down menu.
6. In **KMS Compliant Key**, select your recently created KeyControl Key from the drop down menu.
7. Fill out any other options required.
8. Select **Create**.

The new storage domain is created and added to the **Storage Domains** list.

2.6. Check KeyControl for Cohesity keys

Now that the Cohesity Storage Domain has been created, there should be new keys in KeyControl.

1. Log in to the KeyControl Vault server.
2. Select the **Objects** tab.

There should be new keys listed that were created when the storage domain was created in the Cohesity cluster. Select one of the keys and validate that it is from Cohesity by selecting the **Custom Attributes** tab. For example:

3. Select the **Audit Logs** page from the home screen on the KeyControl Vault page and validate the creation of keys when you created the storage domain in Cohesity. For example:

2.7. Integrating with an Entrust HSM

For guidance on integrating the Entrust KeyControl with a Hardware Security Module (HSM), consult with your HSM vendor. If you are using an Entrust nShield HSM, refer to the *Entrust KeyControl nShield HSM Integration Guide* available at Entrust documentation library.

Chapter 3. Cohesity DataPlatform CLI

You may also configure Entrust KeyControl KMS using the Cohesity DataPlatform CLI. Here are some examples of CLI commands that can be used to configure the KMS.

3.1. Log in to the Cohesity server

```
% iris_cli -server xx.xxx.xxx.xxx -username=admin -password=xxxxxx

Cohesity Command Line Interface.
Version: 1.0
This command line tool helps to run any cluster management operations.

admin@xx.xxx.xxx.xxx>
```

3.2. Create a KMIP KMS

```
admin@xx.xxx.xxx.xxx> kms create-kmip

DESCRIPTION
  Create a new kmip KMS.

PARAMS
  ca-certificate-path      [string]      required  File path to ca-certificate.
  client-certificate      [string]      required  File path to client-certificate.
  client-key              [string]      required  File path to client-key.
  ip                     [string]      required  IP address of the KMS.
  kmip-protocol-version   [string]      required  kmip-protocol-version
  name                   [string]      optional  Name of the KMS.
  port                   [int]         required  KMS Port. Default KMIP port is 5696.
```

3.3. List current KMS settings

```
admin@xx.xxx.xxx.xxx> kms list

KMS ID           : 0
KMS TYPE         : kInternalKMS
KMS NAME         : Internal KMS
KMS CONNECTION STATUS : false

KMS ID           : 5287
KMS TYPE         : kCryptsoftKMS
KMS NAME         : KeyControl
KMS CONNECTION STATUS : true
KMS IP           : xx.xxx.xxx.xxx
KMS PORT         : 5696
KMIP PROTOCOL VERSION : KMIP1_2
CLIENT CERTIFICATE EXPIRY DATE: Wednesday, 02-Nov-22 10:13:59 EDT
```

3.4. Modify Cohesity DataPlatform KMS settings

If you update the Key Management settings after initial configuration, the keychain service must be restarted for the new settings to take effect. This restart is done using the CLI using the following steps.

For instructions on accessing and general use of the Cohesity CLI, please see the **Cohesity CLI** section of the *Cohesity Virtual Edition Setup Guide*.

```
admin@xx.xxx.xxx.xxx> cluster restart service-names="keychain"  
Success: Restarting the cluster services [keychain] ...
```

```

```

Chapter 4. Troubleshooting

You might encounter errors while configuring Entrust KeyControl KMS or Storage Domain settings in Cohesity DataPlatform. The error might be caused by invalid input parameters or communications errors.

The most common errors are:

1. A KMS validation error while configuring the KMS.
2. A KMS unreachable error while creating a Storage Domain.

4.1. KMS validation error with KMS configuration

If the Cohesity cluster cannot communicate with Entrust KeyControl when configuring the Key Management settings, the following generic KMS validation error appears:

```
KMS Validation error.
```

If it does, take the following steps:

1. Verify correct addressing and basic network connectivity between Entrust KeyControl and the Cohesity cluster.
2. Verify port 5696 is configured on the Cohesity DataPlatform KMS settings page and that firewalls are open for that port.
3. If any of the uploaded certificate files or private key file on the Cohesity DataPlatform KMS settings page were created on a Windows system, recreate them on a Linux system.

The Cohesity KMS client only accepts an SSL certificate in PEM format that contains a Unix-style newline character, which is '\n'. Format your certificates accordingly – in Windows, replace '\r\n' with '\n' and on Mac OS, replace '\r' with '\n' – and then load the certificates.

4. Verify that the CA certificate uploaded on the Cohesity DataPlatform KMS settings page is the internal root CA certificate from Entrust KeyControl. The Cohesity cluster needs the root CA certificate to validate the server certificate that is delivered to it while establishing a TLS session.
5. Proper licensing must be in place.

4.2. KMS unreachable error during storage domain creation

When you create a new Storage Domain, the Cohesity cluster immediately sends a key generation request to Entrust KeyControl. If a TLS session is not established or if Entrust KeyControl is unreachable, the Storage Domain will not be created, and you will see the following error:

```
KMS is unreachable. Try again.
```

A possible cause of this error is that the TLS session with Entrust KeyControl has been dropped due to inactivity. The Cohesity cluster will immediately take action to re-establish the connection. You may see an error message indicating that the KMS is unreachable before the connection is re-established. In this case, select **Create Storage Domain** to try again. If the problem was a dropped TLS session, the connection should then re-establish.

If the problem was not just the lack of a TLS session, and there is indeed a connectivity issue of some type, you will either continue to see the KMS is unreachable error or possibly the internal error message below. To resolve this, try the steps in KMS Validation Error above.

Chapter 5. Additional resources and related products

5.1. nShield Connect
